

Township

Clean, high technology industry will be within landscaped industrial parks at the township

The Consortium will build five self-sustainable townships each with a population of 100,000. Each one of the new townships will have its own unique economic base and will be directly served by the infrastructure corridor. Each township has a primary town center with supporting neighborhood centers. The residential areas are planned to include a range of housing models and are situated so that the walking distances to work, school, or shopping are not greater than 0.9 km (½ mile). Elementary schools are located in each neighborhood. Parks and recreation facilities are generously allocated to neighborhoods and town centers. Transportation access to the expressway and internal vehicle and pedestrian circulation patterns are considered carefully. The results are unique communities that are built on a strong foundation of proven town planning principles.

Corporate Township will be the home for the region's increasing number of corporate head-quarters, offices and research and development facilities.

Industrial Center will specialize in clean manufacturing, including “white” durable goods and industrial research and development.

Eco-tourism Center will become a destination for Indians and foreign travelers who wish to learn about the region's rich history, national reserve forests, environmental and water resources, fine and performing arts and historic temples and churches. Utilizing the principles of sustainable development, each township will be designed to address the economic, environmental and social needs of the population. In so doing, the townships will provide citizens with a high quality of life in healthy, efficient world-class communities. In addition, the townships will help move consumers closer to the region's farming communities, thus creating an integrated economic development and a stronger market for farmers.
